

COMP305 SUBMISSION: POSTER

Version 1.0
Computing
COMP305

John Speakman

Introduction

For this assignment, you will create and present a technical poster and orally report the practice-based research you have engaged in as part of the computing artefact.

To complete this worksheet, carry out the following steps

- (A) **Prepare** a brief proposal which will:
 - (i) **outline** the computing artefact you intend to create;
 - (ii) **align** the computing artefact with the specialism you have chosen and its structure of worksheet activities;
 - (iii) **identify** the broader context and potential application of your computing artefact;
 - (iv) **describe** the work required;
 - (v) and **justify** that the computing artefact is feasible in scope.
- (B) **Describe** your progress to your supervisor, ensuring that you:
 - (i) **refer** to the assignment brief that details requirements for your specific module (i.e., choice of specialism);
 - (ii) and **conduct** some form of practice-based research as you implement the artefact, which you could report on.
- (C) **Prepare** a poster that will:
 - (i) **describe** your computing artefact;
 - (ii) **illustrate** the architecture of your computing artefact;
 - (iii) and **justify** key development choices and design decisions.
- (D) **Present**, as an individual, the poster:
 - (i) **articulating** your key design decisions **and** approaches to developing your computing artefact;
 - (ii) **analysing** the merits and flaws of these decisions and approaches;
 - (iii) as well as **explaining** your practice-based research.

Submission instructions

Important: You will need to submit a single-page .pdf version of your poster to the LearningSpace and also present the poster in the timetabled session in order to pass the assignment. Failing to upload work to the LearningSpace or missing the timetabled poster demonstration will result in a non-submission being recorded, and penalties being applied.

Marking Rubric

This rubric applies to the assessment of the **poster** itself and the **report** in the poster demonstration.

Criterion	Weight	Fail	Adequate	Competent	Very Good	Excellent	Outstanding
COMPUTE	20%	- No or limited description of the software architecture. No clear attempt to describe the software. - No UML Diagrams or UML is non-standard and not descriptive of the solution. - Knowledge of system design features is not present or poorly demonstrated. - structure and referencing is missing or poorly applied.	- Some insight into the software architecture. There is a description of the key classes. The data structures and design patterns have been described with no context. - UML Diagrams are mostly complete. The UML notation are mostly correct. - Knowledge of system architectures relevant to the specialism is evident and have been incorporated into the design, but there might be many flaws. Much evidence for partial-mastery of academic conventions. There is some structure. Some sentences and paragraphs are well constructed. The reference section is complete and mostly well-formed in Harvard, ACM or IEEE format.	- Much insight into the software architecture. There is a description of the key classes with reference to their functionality. The data structures and design patterns have been described with context to their application. - UML Diagrams are appropriate. The choice of diagrams are appropriate. There are only minor issues with the notation. - Analysis of system architectures relevant to the specialism is evident and have been incorporated into the design, but there might be several issues to highlight - Some evidence for mastery of academic conventions. There is much structure, highlighting the argument. Most sentences and paragraphs are well constructed, clearly articulating points in the argument. The reference section is complete and entirely well-formed in Harvard, ACM or IEEE format.	- Considerable insight into the software architecture. There is a description of the key classes with reference to their functionality. The data structures and design patterns have been described with context to their application. There is some justification for the selection of data structures and design patterns. - UML Diagrams are directly linked to the software architecture. There are only minor errors in the diagrams. - Analysis of system architectures relevant to the specialism is supported by scholarship and have been incorporated into the design, but there might be a few issues to highlight. - Much evidence for mastery of academic conventions. There is considerable structure, bolstering the argument. Most sentences and paragraphs are well constructed, clearly articulating and signposting points in the argument. The reference section is complete and entirely well-formed in Harvard, ACM or IEEE format.	- Significant insight into the software architecture. There is significant evidence of software design. There is synergy between data structure and design pattern selection. The selection of data structures and design patterns are well justified. - UML Diagrams are of a professional standard. All notation is correct. There are no errors in the diagrams. - Evidence of graphics debugging (screenshots or spreadsheets). - Review and synthesis of system architectures relevant to the specialism is supported by scholarship and has been incorporated into the design, and there is little to critique.	- Achieve excellent proficiency - Poster is of a publishable academic quality.
