

COMP305 WORKSHEET 3: IMPLEMENT AND ITERATE

Version 1.0
Computing
COMP305

John Speakman

Introduction

In this worksheet, you will build on the implementation from worksheet 2, expanding the model and iterating through optimisation or functionality. To complete this worksheet, carry out the following steps:

- (A) **Implement**, through iteration, a working effect or generative geometry model expanding on your prototype from week 2.
- (B) **Explore** alternative and complex derivatives of your implementation and **Document** changes in design and implementation of your model.
- (C) **Profile** and record performance at major iterations.

0.1 Submission Instructions

Continue using the repository from Worksheet 2; you should consider creating a new branch for this worksheet. Any documents, such as images or reports, should be included in the repository.

Marking Rubric

Criterion	Weight	Fail	Adequate	Competent	Very Good	Excellent	Outstanding
COMPUTE	20%	- No or unclear improvement to performance or functionality demonstrated.	- Implementation demonstrated with clear improvement in git repository: either performance or functionality	- Achieve Adequate Proficiency. - Documentation clearly demonstrates profiling, using a standard profiling tool and documentation of a performance metric.	- Achieve Competent Proficiency - Demonstrate clear understanding of technical implementation theory and application	- Achieve Very Good - Demonstrate clear effective technical implementation of algorithms with clarifying documentation	- Achieve Excellent - Implementation demonstrates a novel solution. Effective, solution to a problem, following good programming principles.
